

Supplementary Information for
*quFWI: Hybrid Quantum-Classical Finite Basis
Physics-Informed Neural Networks for Wave
Propagation and Full Waveform Inversion*

Hoang Anh Nguyen, Divakar Vashisth, Ali Tura

Supplementary Figures

Figure S1: Comparison of parameter gradients $\partial f / \partial \theta$ computed by our JAX statevector implementation and PennyLane’s `default.qubit` backend across eight circuit configurations (2–8 qubits, 1–6 layers). All values fall on the identity line $y = x$ with maximum absolute deviation $\Delta < 10^{-7}$, confirming numerical equivalence of the two implementations.

Figure S2: Training loss decomposition for the classical FBPINN baseline on the anomaly benchmark: total loss, PDE residual, displacement-snapshot initial conditions (two components), seismogram misfit, and free-stress boundary condition, plotted versus training iteration. Inset: early-iteration behaviour showing rapid initial loss reduction.

Supplementary Tables

Table S1: Full hyperparameter variant sweep for the anomaly benchmark. $\mathcal{Q}(n_q^{\times n_L})$ denotes a parameterized quantum circuit with n_q qubits and n_L layers. Values marked “—” are identical to the **classical** baseline. Subdomains column shows $\phi(\cdot)$ for wavefield decomposition and $c(\cdot)$ for velocity decomposition.
